ABOUT ME

Senior Software Engineer with 10+ years of experience building and scaling high-traffic web applications end to end. Currently at Edpuzzle, I work on core learning systems used by **2M+ daily active users**, operating high-throughput services (**+10k req/s at the application layer** and **sustaining +50k req/s at the database level** under real production load).

I specialize in full-stack development with strong **backend** expertise (Node.js, MongoDB) and **frontend** experience (React, modern web architectures), as well as system design (DDD, CQRS, event-driven systems). I'm used to **owning features from idea to production**, working closely with product to deliver reliable, scalable, and user-focused solutions.

At Edpuzzle, **I've been actively involved in the team's transition toward an AI-first development approach**. We started by building awareness and trust through workshops and internal initiatives, aligning on the idea that AI augments rather than replaces engineering work. Over time, we standardized tooling (Claude Code), centralized documentation within the codebase to improve AI context, and fostered knowledge sharing through internal talks and dedicated channels. **Since December, we've evolved from basic AI-assisted workflows** (autocomplete and chat) **to a more advanced setup where AI plays a central role in development**, significantly accelerating iteration speed. We still maintain strong engineering practices, including manual reviews and code quality standards, and continue refining what "good code" means in this new paradigm. Outside of work, I complement this approach by experimenting with tools like Codex and Gemini in my personal projects.

I'm particularly interested in **shipping fast, iterating through experimentation, and building systems that connect users with products** in meaningful ways. I actively use AI tools to accelerate development and improve both engineering workflows and product capabilities.

Outside of work, I build and iterate on side projects like [Clipscribe \(github.com/JonathandelaSen/clipscribe\)](https://github.com/JonathandelaSen/clipscribe), exploring AI-driven tools for AI-driven content creation.

WORK EXPERIENCE

• Senior Software Engineer at Edpuzzle

Sep 2024 - Present

- Own features end-to-end for a platform with **2M+ daily active users**, from product discovery to post-release tracking and monitoring, iterating based on real user behavior and system insights.
- Develop and operate **high throughput backend services** using Node.js, Express, MongoDB, and Redis (+10k req/s application layer, +50k req/s at the database level), ensuring scalability and reliability under real production traffic.
- Design and maintain observability and tracking systems using DataDog, building custom dashboards and monitoring pipelines to analyze user behavior, system performance, and product health.
- Build and maintain core platform systems powering classrooms, assignments, submissions, and LMS integrations (including LTI), used by millions of daily active users.
- Contribute to the evolution of Edpuzzle from a video-only platform to a multi-content system, enabling new product capabilities and expanding the platform's value proposition.
- Work on integrations and feature support for Microsoft-based ecosystems, helping extend platform availability and adoption across new user segments.
- Contribute to the adoption of AI-assisted development workflows, evolving team practices and documentation to support an AI-first approach, significantly improving development speed and productivity.

• **Tech Lead at Dezzai**

Sep 2020 - Present

- Collaborated with external partners such as Grupo Prisa (Colombia) to design and build solutions for digitizing traditional media workflows (EGMs), aligning technical implementation with business and user requirements.
- Built and scaled a multidisciplinary engineering team, improving development practices (code reviews, testing culture, internal demos) and overall team maturity.
- Designed backend systems using event-driven architecture, DDD, and scalable data processing pipelines.
- Coordinated closely with data science teams to integrate trained models into production systems, ensuring reliability and performance.
- Temporarily assumed CTO responsibilities during two extended leaves, maintaining engineering delivery and team alignment.

• **Software Engineer at RoadStr**

Sep 2019 - Sep 2020

- **Stack: Node.js (TypeScript), MongoDB, Kotlin for Android, and Swift for iOS. Microservices and partially event-driven architecture with CQRS.**
- Developed and supported RoadStr and Rockr apps with 170K+ users and 30K MAU.
- Improved stability to 99% crash-free users and increased engagement through rapid iteration and weekly releases.
- Built real-time features including driver maps, location sharing, and chat systems using sockets.

• **Co-founder & CTO at Zenfood**

Jun 2018 - Sep 2019

- Built and launched the product end-to-end, from idea to production, generating revenue within the first 4 months.
- Developed backend and mobile applications (Node.js, Express, MongoDB, Android, iOS).
- Managed payments integration (Stripe, Apple In-App Purchases).
- Iterated rapidly based on user feedback using the Lean methodology.

EDUCATION

• **Master’s degree - Web Software Engineering**

Universidad de Alcalá - 9/10

2015 - 2016

• **Degree - Software Engineering**

Universidad Rey Juan Carlos - 7.5/10

2010 - 2015

CAPABILITIES

• **Backend development**

- End-to-end ownership from discovery to post release iteration.
- Close collaboration with product and design to deliver user-focused features.

• **AI & Developer Productivity**

- Adoption of AI-assisted development workflows to accelerate iteration and improve team productivity.

• **Scalable Systems**

- Design and operation of high-throughput backend systems.
- Experience with event-driven architectures and domain-driven design (DDD, CQRS).

• **Frontend & User Experience**

- Building responsive, performant web applications with React and modern architectures.
